Searching a Sorted Sequence

Problem

Let x_1, x_2, \dots, x_n be a sequence of real numbers such that $x_1 \le x_2 \le \dots \le x_n$. Given a real number z, we want to find whether z appears in the sequence, and, if it does, to find an index i such that $x_i = z$.

Searching a Sorted Sequence

Problem

Let x_1, x_2, \dots, x_n be a sequence of real numbers such that $x_1 \le x_2 \le \dots \le x_n$. Given a real number z, we want to find whether z appears in the sequence, and, if it does, to find an index i such that $x_i = z$.

Idea: cut the search space in half by asking only one question.

$$\begin{cases} T(1) = O(1) \\ T(n) = T(\frac{n}{2}) + O(1), n \ge 2 \end{cases}$$

Time complexity: $O(\log n)$ (applying the master theorem with a = 1, b = 2, k = 0, and $b^k = 1 = a$).

Searching a Cyclically Sorted Sequence

Problem

Given a cyclically sorted list, find the position of the minimal element in the list (we assume, for simplicity, that this position is unique).

Example 1:

1 2 3 4 5 6 7 8
[5 6 7 0 1 2 3 4]
The 4th is the minimal element.

Example 2:

1 2 3 4 5 6 7 8
[0 1 2 3 4 5 6 7]
The 1st is the minimal element.

イロト イヨト イヨト イヨト

Searching a Cyclically Sorted Sequence

Problem

Given a cyclically sorted list, find the position of the minimal element in the list (we assume, for simplicity, that this position is unique).

Example 1:

1 2 3 4 5 6 7 8
[5 6 7 0 1 2 3 4]
The 4th is the minimal element.

Example 2:

1 2 3 4 5 6 7 8
[0 1 2 3 4 5 6 7]
The 1st is the minimal element.

😚 To cut the search space in half, what question should we ask?

イロト イポト イヨト イヨト 二日

Cyclic Binary Search

Algorithm Cyclic_Binary_Search (X, n); begin

```
Position := Cyclic_Find(1, n);
```

end

function Cyclic_Find (Left, Right) : integer; begin

if
$$Left = Right$$
 then $Cyclic_Find := Left$ else

$$\begin{array}{l} \textit{Middle} := \lfloor \frac{\textit{Left} + \textit{Right}}{2} \rfloor;\\ \textit{if } X[\textit{Middle}] < X[\textit{Right}] \textit{ then}\\ \textit{Cyclic}_\textit{Find} := \textit{Cyclic}_\textit{Find}(\textit{Left},\textit{Middle})\\ \textit{else} \end{array}$$

$$Cyclic_Find := Cyclic_Find(Middle + 1, Right)$$

end

Yih-Kuen Tsay (IM.NTU)

"Fixpoints"

Problem

Given a sorted sequence of distinct integers a_1, a_2, \dots, a_n , determine whether there exists an index *i* such that $a_i = i$.

Example 1:

1
2
3
4
5
6
7
8

[
-1
1
2
4
5
6
8
9
]

*
$$a_4 = 4$$
 (there are more ...).

*
Example 2:

*
1
2
3
4
5
6
7
8

[
-1
1
2
5
6
8
9
10
]

*
There is no *i* such that $a_i = i$.

"Fixpoints"

Problem

Given a sorted sequence of distinct integers a_1, a_2, \dots, a_n , determine whether there exists an index *i* such that $a_i = i$.

Again, can we cut the search space in half by asking only one question?

Stuttering Subsequence

Problem

Given two sequences $A (= a_1 a_2 \cdots a_n)$ and $B (= b_1 b_2 \cdots b_m)$, find the maximal value of *i* such that B^i is a subsequence of *A*.

• If
$$B = xyzzx$$
, then $B^2 = xxyyzzzxx$, $B^3 = xxxyyyzzzzxxx$, etc.

- *B* is a subsequence of *A* if we can embed *B* inside *A* in the same order but with possible holes.
- For example, B² = xxyyzzzxx is a subsequence of xxzzyyyyxxzzzxxx.

Sorting

Problem

Given n numbers x_1, x_2, \dots, x_n , arrange them in increasing order. In other words, find a sequence of distinct indices $1 \le i_1, i_2, \dots, i_n \le n$, such that $x_{i_1} \le x_{i_2} \le \dots \le x_{i_n}$.

A sorting algorithm is called **in-place** if no additional work space is used besides the initial array that holds the elements.

イロト イポト イヨト イヨト 二日

Using Balanced Search Trees

- Balanced search trees, such as AVL trees, may be used for sorting:
 - 1. Create an empty tree.
 - 2. Insert the numbers one by one to the tree.
 - 3. Traverse the tree and output the numbers.

Using Balanced Search Trees

- Balanced search trees, such as AVL trees, may be used for sorting:
 - 1. Create an empty tree.
 - 2. Insert the numbers one by one to the tree.
 - 3. Traverse the tree and output the numbers.

😚 What's the time complexity? Suppose we use an AVL tree.

Average-Case Complexity of Quick Sort

• When X[i] is selected (at random) as the pivot,

$$T(n) = n - 1 + T(i - 1) + T(n - i)$$
, where $n \ge 2$.

Yih-Kuen Tsay (IM.NTU)

Searching and Sorting

Algorithms 2018 26 / 39

Average-Case Complexity of Quick Sort

When X[i] is selected (at random) as the pivot,

$$T(n) = n - 1 + T(i - 1) + T(n - i)$$
, where $n \ge 2$.

The average running time will then be

$$T(n) = n - 1 + \frac{1}{n} \sum_{i=1}^{n} (T(i-1) + T(n-i))$$

= $n - 1 + \frac{1}{n} \sum_{i=1}^{n} T(i-1) + \frac{1}{n} \sum_{i=1}^{n} T(n-i)$
= $n - 1 + \frac{1}{n} \sum_{j=0}^{n-1} T(j) + \frac{1}{n} \sum_{j=0}^{n-1} T(j)$
= $n - 1 + \frac{2}{n} \sum_{i=0}^{n-1} T(i)$

Solving this recurrence relation with full history, T(n) = O(n log n).

Yih-Kuen Tsay (IM.NTU)
