# The Standard Induction Principle

- Let T be a theorem that includes a parameter n whose value can be any natural number.
- Here, natural numbers are positive integers, i.e., 1, 2, 3, ..., excluding 0 (sometimes we may include 0).
- To prove *T*, it suffices to prove the following two conditions:
  - T holds for n = 1. (Base case)
  - For every n > 1, if T holds for n 1, then T holds for n. (Inductive step)
- The assumption in the inductive step that T holds for n 1 is called the *induction hypothesis*.

# A Simple Proof by Induction

### Theorem (2.1)

For all natural numbers x and n,  $x^n - 1$  is divisible by x - 1.

#### Proof.

(Suggestion: try to follow the structure of this proof when you present a proof by induction.) The proof is by induction on *n*. Base case (n = 1): x - 1 is trivially divisible by x - 1. Inductive step (n > 1):  $x^n - 1 = x(x^{n-1} - 1) + (x - 1)$ .  $x^{n-1} - 1$  is divisible by x - 1 from the induction hypothesis and x - 1 is divisible by x - 1. Hence,  $x^n - 1$  is divisible by x - 1.

Note: *a* is divisible by *b* if there exists an integer *c* such that  $a = b \times c$ . (0 is divisible by any integer, including 0 itself.)

# Variants of Induction Principle

#### Theorem

If a statement T, with a parameter n, is true for n = 1, and if, for every  $n \ge 1$ , the truth of T for n implies its truth for n + 1, then T is true for all natural numbers.

イロト 不得 トイヨト イヨト

# Variants of Induction Principle

#### Theorem

If a statement T, with a parameter n, is true for n = 1, and if, for every  $n \ge 1$ , the truth of T for n implies its truth for n + 1, then T is true for all natural numbers.

### Theorem (Strong Induction)

If a statement T, with a parameter n, is true for n = 1, and if, for every n > 1, the truth of T for all natural numbers < n implies its truth for n, then T is true for all natural numbers.

# Variants of Induction Principle

#### Theorem

If a statement T, with a parameter n, is true for n = 1, and if, for every  $n \ge 1$ , the truth of T for n implies its truth for n + 1, then T is true for all natural numbers.

## Theorem (Strong Induction)

If a statement T, with a parameter n, is true for n = 1, and if, for every n > 1, the truth of T for all natural numbers < n implies its truth for n, then T is true for all natural numbers.

#### Theorem

If a statement T, with a parameter n, is true for n = 1 and for n = 2, and if, for every n > 2, the truth of T for n - 2 implies its truth for n, then T is true for all natural numbers.

## **Design by Induction: First Glimpse**

- The selection sort, for instance, can be seen as constructed using design by induction:
  - 1. When there is only one element, we are done.
  - 2. When there are n (> 1) elements, we
    - 2.1 select the largest element,
    - 2.2 place it behind the remaining n-1 elements, and
    - 2.3 sort the remaining n-1 elements.

#### Problem

Given two sorted arrays A[1..m] and B[1..n] of positive integers, find their smallest common element; returns 0 if no common element is found.

- Assume the elements of each array are in ascending order.
- **Obvious solution**: take one element at a time from *A* and find out if it is also in *B* (or the other way around).

イロト イポト イヨト イヨト

#### Problem

Given two sorted arrays A[1..m] and B[1..n] of positive integers, find their smallest common element; returns 0 if no common element is found.

- 😚 Assume the elements of each array are in ascending order.
- Obvious solution: take one element at a time from A and find out if it is also in B (or the other way around).
- How efficient is this solution?
- 😚 Can we do better?

イロト 不得 トイヨト イヨト

- Solution There are m + n elements to begin with.
- Can we pick out one element such that either (1) it is the element we look for or (2) it can be ruled out from subsequent searches?
- In the second case, we are left with the same problem but with m + n 1 elements?

イロト 不得下 イヨト イヨト

- There are m + n elements to begin with.
- Can we pick out one element such that either (1) it is the element we look for or (2) it can be ruled out from subsequent searches?
- In the second case, we are left with the same problem but with m + n 1 elements?
- Idea: compare the current first elements of A and B.
  - 1. If they are equal, then we are done.
  - 2. If not, the smaller one cannot be the smallest common element.

イロト 不得 トイヨト イヨト

Below is the complete solution:

#### Algorithm

```
Algorithm SCE(A, m, B, n) : integer;
begin

if m = 0 or n = 0 then SCE := 0;

if A[1] = B[1] then

SCE := A[1];

else if A[1] < B[1] then

SCE := SCE(A[2..m], m - 1, B, n);

else SCE := SCE(A, m, B[2..n], n - 1);

end
```

## Another Simple Example

Theorem (2.4)

If n is a natural number and 1 + x > 0, then  $(1 + x)^n \ge 1 + nx$ .

Below are the key steps:

$$\begin{array}{rl} (1+x)^{n+1} &= (1+x)(1+x)^n \\ & \{ \text{induction hypothesis and } 1+x > 0 \} \\ &\geq (1+x)(1+nx) \\ &= 1+(n+1)x+nx^2 \\ &\geq 1+(n+1)x \end{array}$$

The main point here is that we should be clear about how conditions listed in the theorem are used.

Yih-Kuen Tsay (IM.NTU)

Mathematical Induction

# Proving vs. Computing

Theorem (2.2)

$$1+2+\cdots+n=\frac{n(n+1)}{2}.$$

This can be easily proven by induction.

• Key steps: 
$$1 + 2 + \dots + n + (n + 1) = \frac{n(n+1)}{2} + (n + 1) = \frac{n^2 + n + 2n + 2}{2} = \frac{n^2 + 3n + 2}{2} = \frac{(n+1)(n+2)}{2} = \frac{(n+1)((n+1)+1)}{2}.$$

# Proving vs. Computing

#### Theorem (2.2)

$$1+2+\cdots+n=\frac{n(n+1)}{2}.$$

😚 This can be easily proven by induction.

Solve the steps: 
$$1 + 2 + \dots + n + (n+1) = \frac{n(n+1)}{2} + (n+1) = \frac{n^2 + n + 2n + 2}{2} = \frac{n^2 + 3n + 2}{2} = \frac{(n+1)(n+2)}{2} = \frac{(n+1)((n+1)+1)}{2}.$$

Induction seems to be useful only if we already know the sum.

- What if we are asked to compute the sum of a series?
- S Let's try  $8 + 13 + 18 + 23 + \dots + (3 + 5n)$ .

Yih-Kuen Tsay (IM.NTU)

イロト イポト イヨト イヨト 二日

# Proving vs. Computing (cont.)

- Idea: guess and then verify by an inductive proof!
- Solution The sum should be of the form  $an^2 + bn + c$ .
- By checking n = 1, 2, and 3, we get  $\frac{5}{2}n^2 + \frac{11}{2}n$ .
- Verify this for all n (1, 2, 3, and beyond), i.e., the following theorem, by induction.

Theorem (2.3)

$$8+13+18+23+\cdots+(3+5n)=\frac{5}{2}n^2+\frac{11}{2}n.$$

## Euler's Formula (cont.)

#### Theorem (2.8)

The number of vertices (V), edges (E), and faces (F) in an arbitrary connected planar graph are related by the formula V + F = E + 2.

## Euler's Formula (cont.)

#### Theorem (2.8)

The number of vertices (V), edges (E), and faces (F) in an arbitrary connected planar graph are related by the formula V + F = E + 2.

The proof is by induction on the number of faces. Base case (F = 1): connected planar graphs with only one face are trees. So, we need to prove the equality V + 1 = E + 2 or V-1=E for trees, namely the following lemma:

#### Lemma

A tree with V vertices has V - 1 edges.

Inductive step (F > 1): for a graph with more than one faces, there must be a cycle in the graph. Remove one edge from the cyle ...

Mathematical Induction

Algorithms 2023 26 / 38

3

#### Theorem (2.11-)

There exist Gray codes of length  $\lceil \log_2 k \rceil$  for any positive even integer k.

To generalize the result and ease the proof, we allow a Gray code to be *open* where the last name and the first name may differ by more than one bit.

#### Theorem (2.11)

There exist Gray codes of length  $\lceil \log_2 k \rceil$  for any positive integer  $k \ge 2$ . The Gray codes for the even values of k are closed, and the Gray codes for odd values of k are open.

Mathematical Induction

Algorithms 2023 27 / 38

#### Theorem (2.11)

There exist Gray codes of length  $\lceil \log_2 k \rceil$  for any positive integer  $k \ge 2$ . The Gray codes for the even values of k are closed, and the Gray codes for odd values of k are open.

We in effect make the theorem stronger. A stronger theorem may be easier to prove, as we have a stronger induction hypothesis.

#### Arithmetic vs. Geometric Mean

Theorem (2.13)

If 
$$x_1, x_2, \dots, x_n$$
 are all positive numbers, then  
 $(x_1x_2\cdots x_n)^{rac{1}{n}} \leq rac{x_1+x_2+\cdots+x_n}{n}.$ 

First use the standard induction to prove the case of powers of 2 and then use the reversed induction principle below to prove for all natural numbers.

#### Theorem (Reversed Induction Principle)

If a statement P, with a parameter n, is true for an infinite subset of the natural numbers, and if, for every n > 1, the truth of P for n implies its truth for n - 1, then P is true for all natural numbers.

#### **Loop Invariants**

- An *invariant* at some point of a program is an assertion that holds whenever execution of the program reaches that point.
- Invariants are a bridge between the static text of a program and its dynamic computation.

(日) (四) (日) (日) (日)

#### **Loop Invariants**

- An *invariant* at some point of a program is an assertion that holds whenever execution of the program reaches that point.
- Invariants are a bridge between the static text of a program and its dynamic computation.
- An invariant at the front of a while loop is called a *loop* invariant of the while loop.
- I loop invariant is formally established by induction.
  - Base case: the assertion holds right before the loop starts.
  - Inductive step: assuming the assertion holds before the *i*-th iteration  $(i \ge 1)$ , it holds again after the iteration.

IN INAR

### A Variant of Euclid's Algorithm (cont.)

Theorem (Correctness of myEuclid)

When Algorithm myEuclid terminates, x or y stores the value of gcd(m, n) (assuming that m, n > 0 initially).

## A Variant of Euclid's Algorithm (cont.)

Theorem (Correctness of myEuclid)

When Algorithm myEuclid terminates, x or y stores the value of gcd(m, n) (assuming that m, n > 0 initially).

#### Lemma

Let Inv(m, n, x, y) denote the assertion:

$$x > 0 \land y > 0 \land \operatorname{gcd}(x, y) = \operatorname{gcd}(m, n).$$

Then, Inv(m, n, x, y) is a loop invariant of the while loop, assuming that m, n > 0 initially.

## A Variant of Euclid's Algorithm (cont.)

Theorem (Correctness of myEuclid)

When Algorithm myEuclid terminates, x or y stores the value of gcd(m, n) (assuming that m, n > 0 initially).

#### Lemma

Let Inv(m, n, x, y) denote the assertion:

$$x > 0 \land y > 0 \land \operatorname{gcd}(x, y) = \operatorname{gcd}(m, n).$$

Then, Inv(m, n, x, y) is a loop invariant of the while loop, assuming that m, n > 0 initially.

The loop invariant is sufficient to deduce that, when the while loop terminates, i.e., when x = y, either x or y stores the value of gcd(x, y), which equals gcd(m, n).

#### **Proof of a Loop Invariant**

- The proof is by induction on the number of times the loop body is executed.
- More specifically, we show that
  - 1. the assertion is true when the flow of control reaches the loop for the first time and
  - 2. given that the assertion is true and the loop condition holds, the assertion will remain true after the next iteration (i.e., after the loop body is executed once more).

(日) (四) (日) (日) (日)

#### Proof of a Loop Invariant (cont.)

- Sease case: x = m > 0 and y = n > 0, so the loop invariant Inv(m, n, x, y), i.e.,  $x > 0 \land y > 0 \land gcd(x, y) = gcd(m, n)$ , holds.
- lnductive step:

Given Inv(m, n, x, y) (the Induction Hypothesis),  $x \neq y$  (the loop condition), and the effects after the next iteration

$$\begin{array}{l} ((x < y) \rightarrow (x' = y - x) \land (y' = x)) \\ \land \quad ((x > y) \rightarrow (x' = x - y) \land (y' = y)) \\ \land \quad m' = m \\ \land \quad n' = n, \end{array}$$

it can be shown that Inv(m', n', x', y') also holds.
